

**Dig in for a  
showing of...**

**Thursday, February 15  
6-9 PM, Western UC Theatre**

“Roots So Deep” by Peter Byck explores the human relationship with the soil. The film dives into a regenerative model of agriculture that supports soil health and with it the vitality of ecosystems, comparatively studying traditional and regenerative grazing systems using science and experimentation. When humans interact with soils in a regenerative way, they hold more organic matter and more carbon.

Join us to watch a showing, followed by a panel of local landowners whose grazing systems matter to our food supply, the local health of the land, and more widespread ecological resiliency.

Please bring cash for snacks and drinks to support a local middle school group raising funds to travel to the Dominican Republic -- they'll work hard as they learn about tropical agricultural systems!
